

ARC QUANTUM

Investor presentation for Arc-native DeFi infrastructure

A product company focused on making digital asset workflows simpler, clearer, and more reliable on Arc Network.

● ARC NETWORK • PRODUCT LAYER FOR EVERYDAY DEFI

The operating layer for everyday digital asset activity on Arc.

Arc Quantum is building a streamlined and transparent DeFi product for Arc Network, bringing four high-frequency actions into one unified experience: [Bridge](#), [Swap](#), [Unified Balance](#), and [Send](#).

Investment thesis

Use of funds

4 core modules

Bridge, Swap, Unified Balance, and Send combined into one consistent product flow.

Arc-first MVP

Focused on one ecosystem first to optimize UX, reliability, and execution speed.

Expansion-ready architecture

Built with an admin panel, audit logs, wallet authentication, and bridge configuration to improve operating trust.

INVESTMENT THESIS

DeFi only scales when the experience stops feeling expert-only.

Most DeFi products still require users to navigate fragmented tools while managing chains, tokens, fees, and transaction states on their own. Arc Quantum addresses that friction directly by turning the highest-value actions into one coherent product experience.

CURRENT STATUS

The MVP has a clear direction and a technical foundation deep enough for commercialization.

The product already has a defined architecture with a Next.js frontend, backend APIs, PostgreSQL via Prisma, wallet authentication, configuration management, and operational logging.

INVESTOR ANGLE

The opportunity sits in the experience layer and the operations layer, not only in smart contracts.

As Arc expands its application base and asset flows, demand should increase for a trusted entry point covering bridging, swapping, balance management, and token transfers. Arc Quantum is positioning itself at that interaction layer.

PROBLEM

Market problem

DeFi adoption is constrained less by product availability than by complexity, fragmentation, and the cost of user error.

01

Too many steps, too many contexts

Bridging, swapping, checking balances, and sending assets are often fragmented across multiple applications. That creates serious friction for non-expert users.

02

Poor visibility into transaction progress

Many interfaces only show the final result. Users struggle to understand the current state, the cause of a failure, or what to do next when something breaks.

03

A gap between UX and infrastructure

Many teams invest heavily in on-chain infrastructure while underinvesting in the product layer that makes that infrastructure usable at scale.

SOLUTION

How Arc Quantum solves it

An Arc-native DeFi product that consolidates essential asset workflows into one clear, consistent, and operationally reliable experience.

“From fragmented crypto operations to one coherent Arc-native operating surface.”

- Direct wallet connectivity, no private key custody
- Responsive support across desktop and mobile
- Designed to expand into new chains and modules

Bridge

Move assets across chains on Arc with route configuration checks, input validation, logging, and transaction-state visibility.

Swap

Swap tokens on Arc Network through a simple interface built for mainstream users rather than trader-centric complexity.

Unified Balance

Aggregate asset balances into a clearer portfolio view so users do not need to inspect each token or touchpoint separately.

Send

Transfer tokens to another address with a clearer UX for payments, transfers, and everyday activity on Arc.

WHY NOW

Why this timing matters

As blockchain ecosystems gain more products and liquidity, the experience layer becomes a strategic advantage rather than a thin wrapper around protocols.

Arc needs more accessible application surfaces

If Arc expands its user base, demand for simple asset entry points should deepen across both breadth and usage intensity.

Mainstream users remain underserved

Most DeFi products still optimize for users already comfortable with chains, bridges, and specialist tools, leaving a large gap in the new-user segment.

A focused MVP is easier to commercialize

Starting with one ecosystem, one target user, and four high-value use cases creates a clearer path to product-market fit than expanding across multiple chains too early.

PRODUCT MOAT

Practical competitive advantage

The advantage is not simply breadth of features. It is the combination of product simplicity, operational discipline, and expansion-ready architecture.

Built for mainstream users

- Clear target audience: users who do not need deep blockchain expertise.
- Fewer use cases, but the right ones with high frequency and clear value.
- Strong emphasis on real-time feedback, clear transaction states, and short action flows.

An operating base for a financial product

- Signature-based wallet authentication with no private keys sent to the server.
- An admin panel to manage tokens and bridge configuration.
- Audit logs and transaction history for control, failure handling, and transparency.

ARCHITECTURE READINESS

Current technical foundation

Arc Quantum has already been structured as an independent web application with backend and data layers designed for live operations.

Frontend

Next.js for the interface, state management, and wallet connection flows.

Backend

API routes for validation, history, configuration, and operational workflows.

Data Layer

PostgreSQL and Prisma for transactions, token config, bridge config, admin roles, and audit logs.

Chain Integration

Arc Network integration with a service layer for bridge workflows, retries, and transaction-state control.

The current architecture reflects a product designed for operational use, not only for demonstration.

MONETIZATION

Revenue paths

The initial objective is to prove product usage and execution quality, then expand monetization through increasing ecosystem depth and operating leverage.

Transaction fees

Charge small fees on bridge, swap, or other asset flows where the UX and orchestration layer creates clear value.

B2B enablement

Provide white-label experience infrastructure for teams in the ecosystem that need wallet, bridge, or balance layers.

Value-added services

Expand into analytics, alerts, transaction acceleration, premium workflows, or compliance-ready admin tooling as scale increases.

USE OF FUNDS

Planned capital allocation

Capital will be directed toward the areas most likely to accelerate product-market fit, operational reliability, and measured growth.

1. Product completion and reliability

- Improve bridge flows, retry logic, transaction visibility, and failure UX.
- Raise the quality of the dashboard, balance layer, and transaction history.
- Increase backend stability, endpoint security, and configuration control.

2. Early user growth

- Simplify onboarding for new Arc users.
- Partner with ecosystem projects to create real usage flows.
- Test acquisition channels focused on Arc retail users.

3. Operations and data

- Build measurement systems for conversion, retention, and module-level usage behavior.
- Refine admin workflows for token management, bridge routes, and audit review.
- Create a stronger basis for expansion decisions around chains and new use cases.

4. Preparing for scale

- Validate the strongest monetization path across fees, B2B enablement, or product-layer revenue.
- Standardize the architecture for future chain and module expansion once signals are clear.
- Improve the product data room for the next financing round.

ROADMAP

Proposed 12-month roadmap

A focused roadmap centered on product completion, growth efficiency, and disciplined expansion.

Q1

Complete an operational MVP

Focus on bridge, swap, send, unified balance, transaction history, wallet UX, and the admin layer for core configuration.

Q2

Measure and improve retention

Deploy conversion funnel tracking, remove friction points, improve transaction completion, and strengthen trust signals in the product.

Q3

Expand monetizable use cases

Test fee layers, ecosystem partnerships, and additional product surfaces built on real usage data.

Q4

Scale based on market signals

Decide whether to add chains, new modules, or go deeper into the strongest vertical based on user behavior and economics.

CALL TO ACTION

What investors are buying into

A clear thesis on how Arc can become more accessible through the right product layer for everyday users and asset flows.

Core thesis

Arc Quantum is positioned to become a default operating surface for users who value simplicity, speed, and transparency when interacting with Arc Network.

Why participate early

The company is at a stage where strategic capital can directly improve product quality, accelerate market learning, and strengthen category positioning within the ecosystem.

CLOSING VIEW

Arc Quantum is building the product layer that can make Arc easier to use, easier to trust, and easier to scale.

By focusing on the highest-frequency digital asset workflows and pairing them with a disciplined operating foundation, the company is positioned to capture meaningful value as Arc adoption expands.
